

Renormalization Methods

Annick LESNE

Wiley (1998)

Table of contents

Preface	v
Foreword by Pierre Collet	xiii
Chapter 1 – Principles and physical framework	
1.1 - Introduction	
1.2 - Critical phenomena	
1.2.1 <i>The critical liquid–gas transition of a pure substance</i>	2
1.2.2 <i>Other examples of critical phenomena</i>	8
1.2.3 <i>Checkerboards and balloons: two classes of phenomena</i>	9
1.2.4 <i>Universality of the critical properties</i>	11
1.3 - Terminology	
1.3.1 <i>Systems, structure rules and genericity</i>	12
1.3.2 <i>Characteristic scales</i>	14
1.3.3 <i>Thermodynamic limit and asymptotic regime</i>	16
1.3.4 <i>Scaling laws and exponents</i>	17
1.3.5 <i>Control parameter</i>	18
1.3.6 <i>A remark on the term “renormalization”</i>	19
1.4 - Renormalization methods	
1.4.1 <i>Why?</i>	20
1.4.2 <i>How?</i>	23
1.4.3 <i>When?</i>	24
1.4.4 <i>Universality classes</i>	25
1.4.5 <i>A brief history</i>	25
Chapter 2 – A comparative study of two typical examples	
2.1 - The one-dimensional Ising model	
2.1.1 <i>The model and its importance</i>	31
2.1.2 <i>Analysis via renormalization</i>	33

2.1.3	<i>Results and extensions</i>	36
2.2	- The period-doubling scenario	
2.2.1	<i>Discrete dynamical systems</i>	39
2.2.2	<i>The pitchfork bifurcation</i>	41
2.2.3	<i>The period-doubling scenario</i>	43
2.2.4	<i>Renormalization analysis</i>	46
2.3	- A comparative table	
Chapter 3 – Mathematical aspects		
3.1	- Renormalization operators	
3.1.1	<i>Goals and typical approaches</i>	53
3.1.2	<i>Transfer of limits</i>	59
3.1.3	<i>Fixed points and critical manifolds</i>	60
3.1.4	<i>Renormalization of a one-parameter family</i>	63
3.2	- Mathematical study of critical systems	
3.2.1	<i>The probabilistic approach to a critical phenomenon</i>	67
3.2.2	<i>Fluctuations and correlations</i>	71
3.2.3	<i>Mean-field theories and the law of large numbers</i>	74
3.2.4	<i>Critical phenomena and finite-size scaling</i>	77
3.3	- Numerical methods	
3.3.1	<i>Simulation of critical phenomena</i>	79
3.3.2	<i>Periodic boundary conditions and renormalization</i>	80
3.3.3	<i>Numerical resolution of the renormalization equations</i>	80
3.3.4	<i>Renormalization and the Monte-Carlo method</i>	81
3.4	- Renormalization groups	
3.4.1	<i>Renormalization groups, Lie groups and infinitesimal generators</i>	85
3.4.2	<i>Transformation groups and associated symmetries</i>	88
3.4.3	<i>Representations and symmetry groups</i>	90
Chapter 4 – Statistical mechanics		
4.1	- The example of ferromagnetism	
4.1.1	<i>Magnetic media and ferromagnetic transition</i>	95
4.1.2	<i>Langevin theory and Curie's law</i>	98
4.1.3	<i>Mean-field theory and the Curie–Weiss law</i>	99
4.2	- Critical points	
4.2.1	<i>Goals of a theory of critical phenomena</i>	102
4.2.2	<i>Ferromagnetic and liquid–gas transitions</i>	104
4.2.3	<i>Limits of the methods preceding renormalization</i>	105
4.3	- Renormalization techniques	
4.3.1	<i>Methods in real space</i>	107
4.3.2	<i>Fields and path integrals</i>	110

4.3.3	<i>Renormalization in conjugate space</i>	112
4.3.4	<i>The main universality classes</i>	113
4.4	Dynamic critical phenomena	
4.4.1	<i>Qualitative aspects</i>	116
4.4.2	<i>Renormalization methods</i>	118
Supplement 4A – Graph analysis		
4A.1	<i>The Gaussian model and perturbative expansions</i>	123
4A.2	<i>Analytic expression of the graphs</i>	125
4A.3	<i>Approximations and results</i>	127
Supplement 4B – Spin glasses		
4B.1	<i>Paramagnetism, ferromagnetism and spin glasses</i>	129
4B.2	<i>Frustrated systems</i>	130
4B.3	<i>Transition to the spin-glass phase</i>	133
4B.4	<i>Renormalization methods</i>	134
Chapter 5 – Dynamical systems and chaos		
5.1	Deterministic chaos	
5.1.1	<i>Asymptotic dynamics</i>	137
5.1.2	<i>Discretization methods</i>	139
5.1.3	<i>Chaotic properties</i>	140
5.1.4	<i>Scenarios towards chaos and adapted renormalization methods</i>	145
5.1.5	<i>Transition towards chaos and critical phase transitions</i>	148
5.1.6	<i>Power spectrum and correlation time</i>	151
5.1.7	<i>Dynamical systems with noise</i>	155
5.2	The period-doubling scenario	
5.2.1	<i>Self-similarity of the bifurcation scheme</i>	157
5.2.2	<i>Self-similarity of the critical attractor</i>	160
5.2.3	<i>Renormalization analysis</i>	162
5.3	The intermittency scenario	
5.3.1	<i>Description of the scenario</i>	164
5.3.2	<i>Renormalization analysis</i>	166
5.3.3	<i>The influence of noise</i>	167
5.4	The scenario of Ruelle, Takens and Newhouse	
5.4.1	<i>Quasi-periodic attractors and strange attractors</i>	168
5.4.2	<i>The theorem of Ruelle and Takens</i>	169
5.5	KAM theory and Hamiltonian chaos	
5.5.1	<i>The Hamiltonian formalism</i>	171

5.5.2	<i>The KAM theorem and Moser’s “twist” theorem</i>	172
5.5.3	<i>Renormalization and universal properties</i>	175
Supplement 5A – Ergodic theory and related statistical results		
5A.1	<i>Invariant measures</i>	181
5A.2	<i>Ergodicity and the law of large numbers</i>	183
5A.3	<i>Temporal correlations and the mixing property</i>	186
5A.4	<i>The microcanonical hypothesis and ergodicity</i>	188
Supplement 5B – Fibered renormalization		
5B.1	<i>External influences and fibered formalism</i>	191
5B.2	<i>Renormalization in the presence of noise</i>	192
5B.3	<i>Linear analysis and spectral decomposition</i>	194
5B.4	<i>Critical exponents: results and conclusions</i>	196
Supplement 5C – Renormalization of circle mappings		
5C.1	<i>Circle mappings and rotation numbers</i>	199
5C.2	<i>Continued fraction expansions and the golden ratio</i>	201
5C.3	<i>Asymptotic stability and renormalization</i>	203
5C.4	<i>Universal properties</i>	205
Supplement 5D – Fully developed turbulence		
5D.1	<i>Fully developed turbulence and deterministic chaos</i>	207
5D.2	<i>Hydrodynamic equations and Richardson’s cascade</i>	208
5D.3	<i>Renormalization for large-scale dynamics</i>	210
Chapter 6 – Stochastic diffusion		
6.1 - Spatio-temporal evolution		
6.1.1	<i>The example of Brownian motion</i>	219
6.1.2	<i>Random motion and diffusion laws</i>	223
6.1.3	<i>Formalization: stochastic processes and random walks</i>	225
6.2 - Space–time renormalization		
6.2.1	<i>Renormalization of Brownian motion</i>	227
6.2.2	<i>Asymptotic behavior and renormalization of the process</i>	229
6.2.3	<i>Self-similar processes</i>	232
6.2.4	<i>Renormalization of the probabilities of transition</i>	235
6.2.5	<i>The example of diffusion in a disordered medium</i>	237
Supplement 6A – Polymer physics		
6A.1	<i>Polymer physics</i>	247
6A.2	<i>Polymer chains and random walks</i>	248

6A.3 Geometric renormalization methods	254
6A.4 Polymers in statistical mechanics	259
Chapter 7 – Fractal structures	
7.1 - Fractal geometry	
7.1.1 Critical aspects of fractal structures	265
7.1.2 Real inhomogeneous fractals	269
7.2 - Fractal measures	
7.2.1 Local dimension and dimension spectrum	271
7.2.2 Multifractal analysis	273
7.2.3 Renormalization of a measure	276
7.3 - The wavelet transform	
7.3.1 Transformation formulas	278
7.3.2 Local scale invariance and renormalization	279
Supplement 7A – Percolation	
7A.1 Percolation models: clusters and percolation threshold	285
7A.2 Static aspects	290
7A.3 Renormalization methods	294
7A.4 Dynamic aspects	300
Appendix I – Measures and probabilities	
I.1 Measurable spaces and measures	305
I.2 Random variables and stochastic convergence	306
I.3 Stochastic processes and Markov chains	308
Appendix II – Dynamical systems	
II.1 Discrete dynamical systems	311
II.2 Continuous dynamical systems	313
II.3 Stable and unstable manifolds	315
II.4 Ergodic theory	317
Appendix III – Thermodynamic formalism	
III.1 The microcanonical ensemble	321
III.2 The canonical ensemble	322
Appendix IV – The Fourier transform	
IV.1 Transformation formulas	325
IV.2 Basic properties	326
Bibliography	329
Index	351
